

Change Log

All notable changes to this project will be documented in this file.

The format is based on Keep a Changelog, and this project adheres to Semantic Versioning.

[Unreleased]

Added

- Legacy migration pipeline: `SurveyExtractor/SurveyFileWriter` split the monolithic legacy CSV into per-survey files; `BatchUploader` validates and uploads them to SQL Server in transactions (rollback on failure); `step1-step3` scripts and `run_full_migration.m` drive the end-to-end run.
- Validation framework: `SurveyValidator` orchestrates 9 rule modules (coordinate, datetime, species, behavioral, environmental, beaufort, foreign-key, required-fields, photos/platform). `ErrorCollector` tracks errors/warnings/info with stable `rule_ids`.
- Warning override system: curators acknowledge expected warnings via a version-controlled CSV (`config/overrides/<batch>_overrides.csv`), matched per-row or per-survey. See `docs/warning_overrides.md`.
- Layered config system (`load_config`: defaults → local → batch overrides), replacing the older `get_config` cached singleton.
- Data-driven NUMBER/NUMCALF group-size thresholds: `SPECCODE` → `TAXCODE` → global-default cascade, adjustable via lookup-table CSVs with no code change.
- Routine (per-contributor-season) ingestion pipeline: `convert_contributor_batch` resolves a contributor's parser by name and splits its output by `FILEID`; `run_batch_upload` shares the `connect→upload→stats→close` logic with the migration pipeline's `step2_upload_surveys`.
- `NEAQFormat` parser (reference implementation for a header-based contributor format) and `TemplateFormat.m` as the starting point for new contributor parsers.
- SQL schema, verification, curation, and teardown scripts under `scripts/sql/`.

Changed

- `ParserFactory` simplified to explicit `createByName()` selection; removed content-sniffing auto-detection and the unused `TabDelimitedFormat/SurveyReader` classes.
- `apply_known_fixes.m` promoted to the primary Category C correction path (previously planned as SQL-only); the SQL version is now the post-upload fallback.

Deprecated

Removed

Fixed

- Moved entire project to a fresh repository and set up a structure. The old repository had become very unorganized and contained a lot of old unused code.
- `species_rules/datetime_rules` errors now carry `EVENTNO`, matching what `behavioral_rules` warnings already did, so error output is traceable to a specific event row.
